Ergonomics Process Checklist

Back

☐ Design space to move freely avoiding any twisting.

☐ Provide self-leveling lift tables or mechanical lifts to prevent bending.

Shoulder

☐ Work height allows for shoulder angles no greater than 45 degrees (respect to torso & side of body).

Wrist

☐ Supply tools to keep wrist in a neutral position.

Anti-Fatigue Matting

☐ 15/16" thick with yellow beveled edges.

State of Wisconsin Lifting Summary

Lifting, Moving, or Restraining Load injuries continue each year to be a leading cause and worker’s compensation expense driver for State of Wisconsin employees. Over the past ten fiscal years, State of Wisconsin employees sustained 5,862 worker’s compensation claims as a result from Lifting, Moving, or Restraining a Load. Over the same time period, the State of Wisconsin paid $41,299,376 on Lifting, Moving, or Restraining Load claims:

In effort to reduce Lifting, Moving, or Restraining Load injuries for State of Wisconsin employees, the Bureau of State Risk Management & UW System Risk Management partnered in producing the included statewide campaign:

- Stretch – Improve Flexibility and Reduce Tightness
- Protect Your Backs – Proper Lifting Techniques
- Moment – Power Zone Lifting
- Proper Transfer Techniques – Guidelines for Nursing
- Shovel – Prevent Snow Shoveling Injuries

Supplement:

- Ergonomics Process Checklist
The overall goal of ergonomics is to match the job demands to the capabilities of humans. Primary focus should remain on changing the job demands but stretching compliments good engineering solutions. Humantech research indicates stretching in itself may not reduce musculoskeletal disorders but it may improve flexibility and reduce tightness.

Stretch slowly and gently prior to activity; don’t force a muscle to stretch. Take deep breaths when stretching.

**SHOULDER STRETCH**
Stand, hands clasped behind head. Pull elbows back as far as possible. Hold ten seconds.

**LOW BACK STRETCH**
Place hands on lower back. Using hands as support, arch backward. Try to keep knees straight. Hold ten seconds.

**SIDE STRETCH**
Stand, one arm straight overhead. Place other hand on hip and bend to that side as far as is comfortable. Hold ten seconds. Repeat to other side.
PROTECT YOUR

Balanced gradual lifting

Aid used for excessive weights

Comfortable lifting

Keep objects close to your body

Straight posture avoiding any twisting or bending

PRODUCE IN PARTNERSHIP WITH BUREAU OF STATE RISK MANAGEMENT AND UW SYSTEM

Prevent Snow “Shovel” Injuries

According to the Center for Injury Research and Policy, an estimated 11,500 snow shovel-related injuries and medical emergencies are treated annually in United States Emergency Departments. The most common mechanism of injury/nature of medical emergency was acute musculoskeletal exertion (54%). Also of note, most snow shovel-related incidents (96%) occurred in and around the home.

There are a number of simple tips to help prevent musculoskeletal outdoor winter work injuries:

Stretch before & after

Have right size & height tools

Operate regularly staying ahead of storm

Value pushing light amounts of snow

Eliminate twisting

Lift using legs & keeping back straight

Quick and easy tips for clearing the driveway:

1. Clear a strip down the middle of the driveway.
2. Push the snow on one side towards the outer edge.
3. Repeat on the opposite side of the driveway.

Produced in partnership with Bureau of State Risk Management and UW System
Prevent Snow “Shovel” Injuries

S - Stretch before & after
H - Have right size & height tools
O - Operate regularly              staying ahead of storm
V - Value pushing light amounts       of snow
E - Eliminate twisting
L - Lift using legs & keeping back straight

Center For Injury Research and Policy Facts:

An estimated 11,500 snow shovel-related injuries and medical emergencies are treated annually in United States Emergency Departments.

The most common mechanism of injury/nature of medical emergency was acute musculoskeletal exertion (54%).

Most snow shovel-related incidents (96%) occurred in and around the home.

PROTECT YOUR BACKS

Over the past five years, the State of Wisconsin averaged 331 new coded low back workers compensation claims per year representing 11% of total new claims and the #1 body part injured. The average annual spend on all coded low back workers compensation claims was $2,631,707 representing the #2 most costly body part.

Proper body mechanic strategies to protect:

B - Balanced gradual lifting
A - Aid used for excessive weights
C - Comfortable lifting
K - Keep objects close to your body
S - Straight posture avoiding twisting or bending

Liberty Mutual provided the following ergonomic research figures and training to protect workers from the risk of manual material handling injuries:

1.  Choose the position that feels best, preferably maintaining natural back curvature.
2.  Do not place objects on the floor if they must be picked up later.  Use a table, platform or hoist device.
3.  Leave enough room to be able to turn your feet instead of your hips or shoulders. Never twist and bend at the same time.
4.  Handle objects close to the body.  Don’t reach out to pick up an object. Get help with bulky loads.
5.  If the load is too heavy to lift comfortably, don’t lift it.  Get help or use a mechanical aid.
6.  Grasp the object firmly with both hands.  Prepare for the lift and look forward.
7.  Get a good grip on the object and lift smoothly and slowly. Avoid jerking to lift or pull the load. Breathe out as you lift.
8.  Minimize the distance the load has to be moved (both vertically and horizontally).
9.  Push or slide the load rather than lift or lower it.

Minimized load weights
Eliminates
Needless Trauma

MOMENT

In Physics, moment is the force acting over a distance: Moment = (Force) x (Distance). Moment can also be expressed as the weight of load multiplied by the distance from the center of weight of load to a fulcrum. Picture the intervertebral disc as the fulcrum of a “teeter totter.” Applying the moment formula to a lifting scenario, imagine holding a 40 pound sack of flour 20 inches extended in front of the body. This would equate to approximately 800 pounds of compressive force to the lower spine. Research suggests that low back pain risk increases when the compressive force at the L5-S1 disc exceeds 770 pounds. Please consider that this scenario only includes moment from the load and does not consider additional exposure factors from movements or upper body mass weight. Keeping the load weight to a minimum is extremely important reducing the risk factor in the moment equation. The NIOSH lifting equation always uses a load constant multiplier of 51 pounds, which represents the maximum recommend load weight to be lifted under ideal conditions. Staying in the power zone for lifting close to the body, between mid-thigh and mid-chest height, also limits the distance risk factor. This zone is where the arms and back can lift the most with the least amount of effort. This can also be called the “hand shake zone” or “comfort zone.” The principle is to ensure “shaking hands with work,” to minimize excessive reach and maintain neutral posture.

# OSHA Recommended Transfer Techniques

## Patient Condition
- Not Cooperative
- Can Partially Assist
- Cannot Bear Full Weight
- No Upper Body Strength

## Tasks
- Not Cooperative
- Can Partially Assist
- Cannot Bear Full Weight
- No Upper Body Strength

## Recommendations

### Transfer To and From:
- **Bed to Chair**
- **Chair to Toilet**
- **Chair to Chair**
- **Car to Chair**
- **Bed to Wheelchair**

- **Gait/Transfer Belt** using a Stand and pivot technique - 1 caregiver OR
  - **Powered Standing Assist Lift** - 1 caregiver
  - **Full Body Sling Lift** - 2 caregivers

- **Seated Transfer Aid:** may use Gait/Transfer Belt until the patient is proficient in completing transfer independently.

### Reposition in Bed:
- **Side to Side**
- **Side up Straight**

- **Friction Reducing Device:**
  - patients < 200lbs: 2-3 caregivers
  - patients > 200lbs: 3 caregivers

- **Friction Reducing Device or Full Body Sling Lift:** 2 or more caregivers.

### Reposition in Chair:
- **Wheelchair**
- **Dependency Chair**

- **Friction Reducing Device:**
  - for reclining chair: 2 caregivers, Non-Powered Stand Assist Aid: for non-reclining chairs.

- **Full Body Sling Lift:** 2 or more caregivers.

---

*Reference OSHA 3182-3R-2009 Guidelines for Nursing Homes.*

*All caregivers are recommended to consult with lead medical staff before utilizing lifting devices.*

*Always err on the side of caution; lifting equipment offers greater protection than manual handling.*

---

**Steps**

**To**

**Reduce**

**Extra**

**Tightness of Muscles and**

**Cultivate**

**Healthy Flexibility**

The overall goal of ergonomics is to match the job demands to the capabilities of humans. Primary focus should remain on changing the job demands but stretching compliments good engineering solutions. Humantech research indicates stretching in itself may not reduce musculoskeletal disorders but it may improve flexibility and reduce tightness.

**SHOULDER STRETCH**
- Stand, hands clasped behind head.
- Pull elbows back as far as possible.
- Hold ten seconds.

**LOW BACK STRETCH**
- Place hands on lower back.
- Using hands as support, arch backward.
- Try to keep knees straight.
- Hold ten seconds.

**SIDE STRETCH**
- Stand, one arm straight overhead.
- Place other hand on hip and bend to that side as far as is comfortable.
- Hold ten seconds.
- Repeat to other side.

Proper Transfer Techniques

Lower back injuries are the most costly musculoskeletal disorder affecting workers. Studies of back-related workers compensation claims reveal that nursing personnel have the highest claim rates of any occupation or industry.

According to the National Institute of Occupational Safety and Health (NIOSH) and the American Nurses Association:

- 53% of the work-related injuries and illnesses among nursing, psychiatric, and home health aides were related to overexertion and musculoskeletal disorders.

- OSHA recordable injury rates decreased by 46% after lifting equipment was implemented.

- Patient handling programs have led to a 60-95% reduction of injuries at various VHA hospitals.

- Healthcare workers have 4.5 times as many back overexertion injuries than any other type of worker.

Proper utilization of lift aid techniques can substantially reduce these types of injuries and increase the long-term health of nursing personnel. OSHA completed a study, Guidelines for Nursing Homes, which provides basic knowledge for nursing staff to safely transfer patients including:

- The level of assistance the resident requires
- The size and weight of the resident
- The ability and willingness of the resident to understand and cooperate
- The medical conditions that may influence transfer methods

Please reference poster included for detailed table of OSHA recommendations.

*All caregivers are recommended to consult with lead medical staff before utilizing lifting devices.

*Always error on the side of caution; lifting equipment offers greater protection than manual handling.
